EST Internship Report

Title: AskDoc RAG System
Author: Ismail El Ayade

Abstract
This project builds a retrieval-augmented generation system that reads PDFs, extracts structured information, searches documents semantically, and answers questions with citations.

Evaluation Method
The system is evaluated with a collection of reports. Users upload documents and ask questions. Each answer must include the source filename and page number.

Conclusion
AskDoc uses BGE embeddings, a Chroma vector database, BGE reranking, and Ollama to generate cited answers from uploaded PDFs.

Appendix

The default embedding model is BAAI/bge-small-en-v1.5.
The reranker is BAAI/bge-reranker-base.
Generation is performed locally with Ollama.
